

HyperText Transfer Protocol (HTTP)

AUBURN UNIVERSITY

CPSC 4970 Applied Cyber Security

What is HTTP?

- **A Protocol**
 - Standard procedure for defining and regulating communication.
 - FTP, TCP, UDP, HTTP, SMTP
- World Wide Web **communication standard**
 - HTTP is the lingua franca of the WWW
- Application-layer protocol for transferring data
 - Between server and client
 - Data can be plaintext, hypertext, image, video, etc.

HTTP Relevance To Security

- Pervasiveness of HTTP today in the interconnectedness of mobile devices, physical devices (IoT), clients, servers make it the most common attack surface.
- Many vulnerabilities exist in the communication and execution of HTTP requests on browser and server side
- Having a good understanding of HTTP protocol basics enables effective use of security scanning tools and how vulnerabilities work.
- Vulnerability scanning and mitigations are related how HTTP communications are structured.
 - HTTP Headers
 - HTTP Encryption
- HTTP is a relatively straightforward protocol to understand.

History of the World Wide Web

- 1989 – [“Information Management: A Proposal”](#)
 - Tim Berners-Lee, CERN March 1989
 - “Mesh” —> “World Wide Web”
- 1991 - First World Wide Web site
- 1993 - Mosaic - first widely adopted browser
 - Lead by Marc Andreessen and James Clark
- 1994 – Netscape founded by Andressen and Clark
- 1994 – World Wide Web Consortium (W3C) founded by Lee
 - Develops standards for the Web.

How HTTP Works

- HTTP communicates between two applications
 - An client program - typically a browser, sending connection requests
 - A server program - typically a web server, receiving and responding to requests

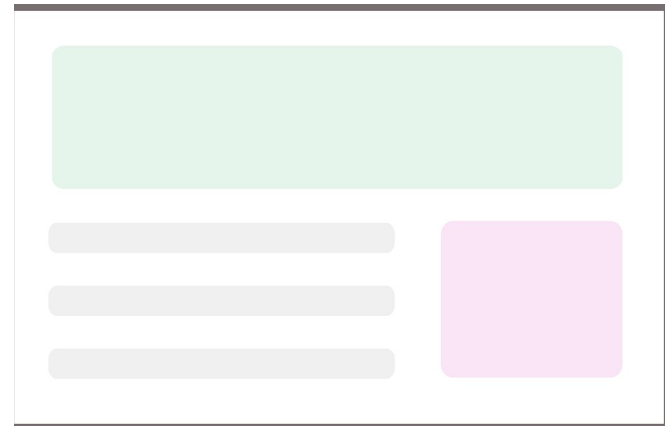

How the Magic work.

We click on a Hyperlink

And a browser page is rendered

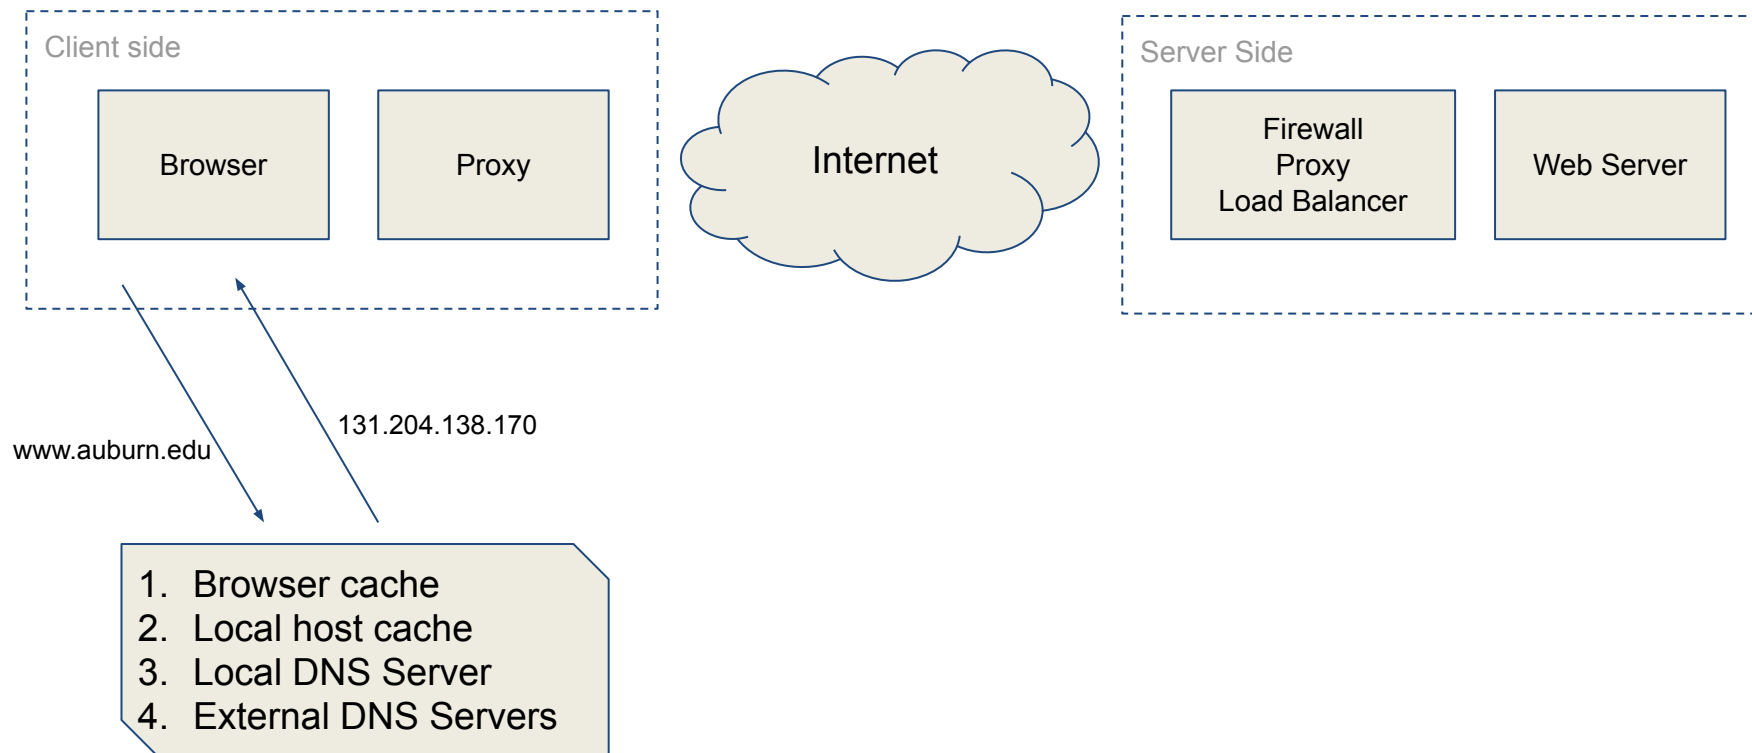

AUBURN

DNS Lookup of “www.auburn.edu”

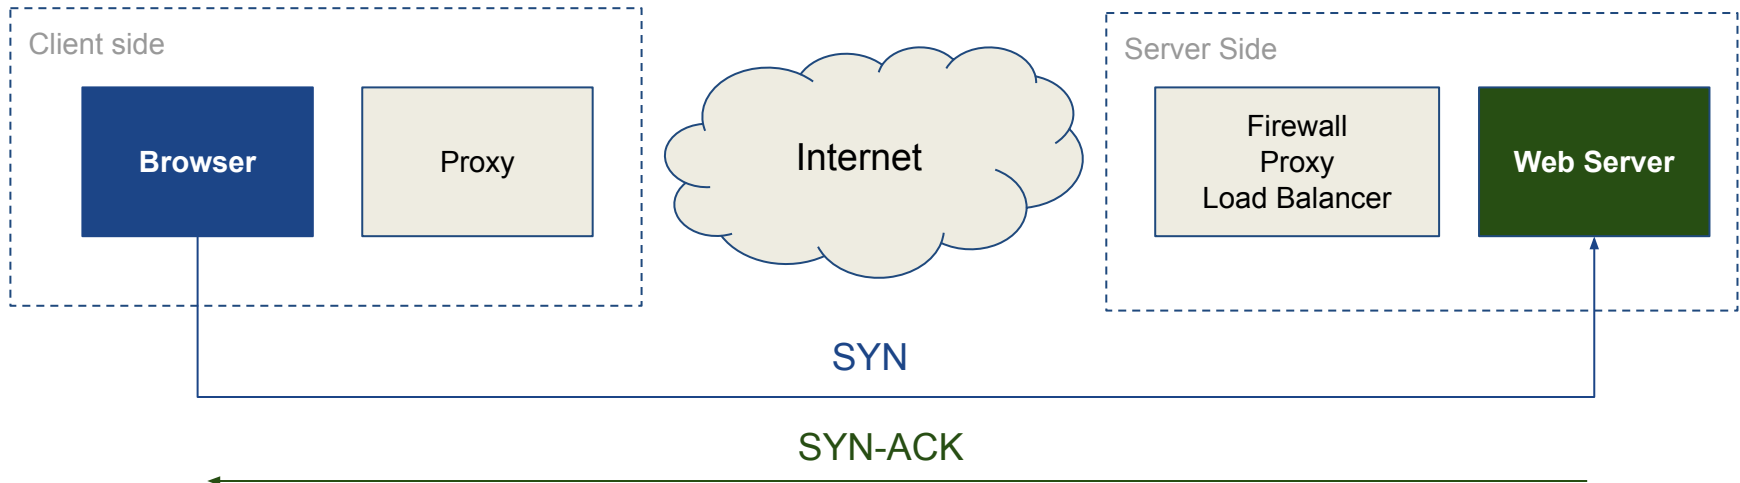

TCP Socket Connection to IP Address

TCP Connection: "Hello There"

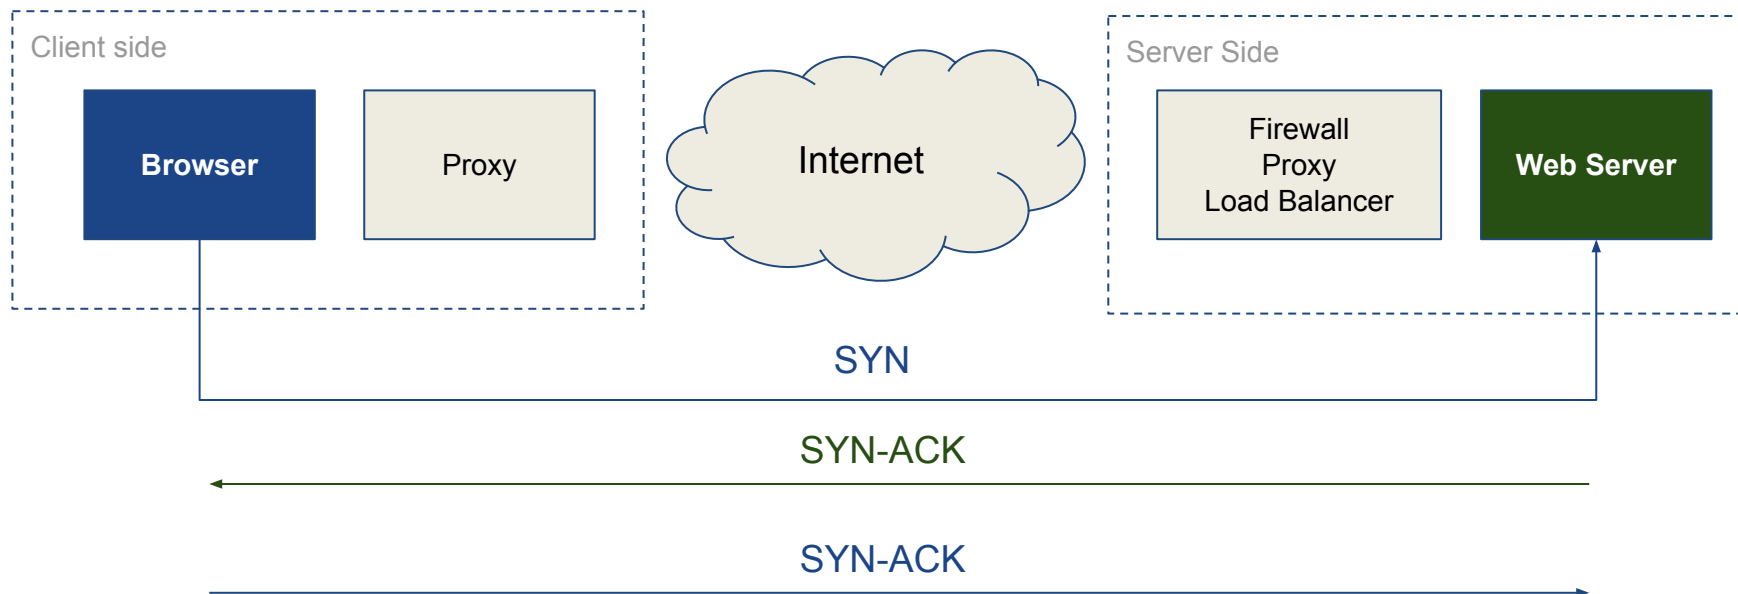

TCP Socket Connection to IP Address

TCP Connection: "Hello Back"

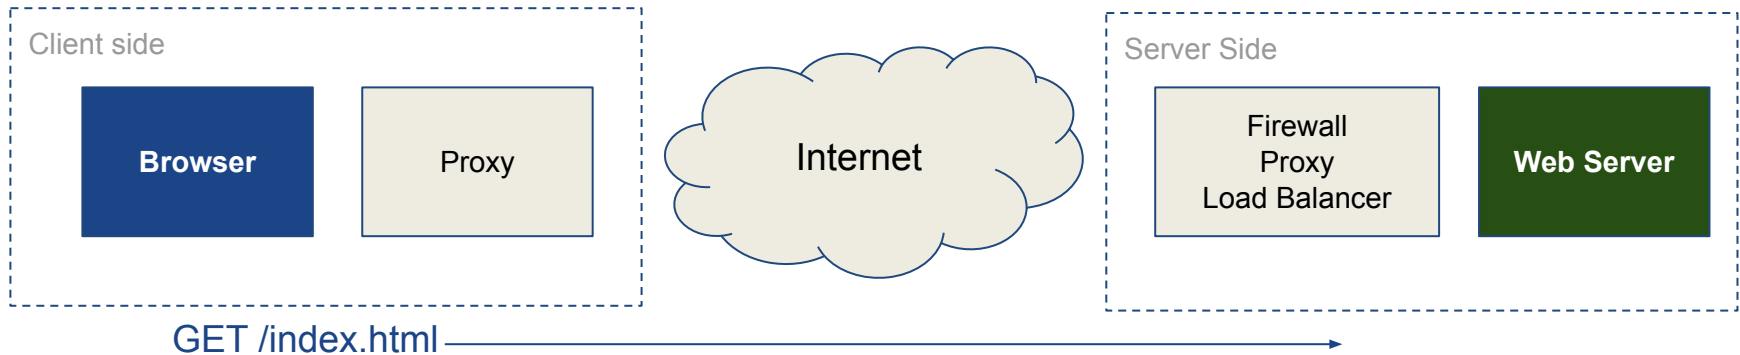

TCP Socket Connection to IP Address

TCP Connection: "Let's Chat" - Connection Established!

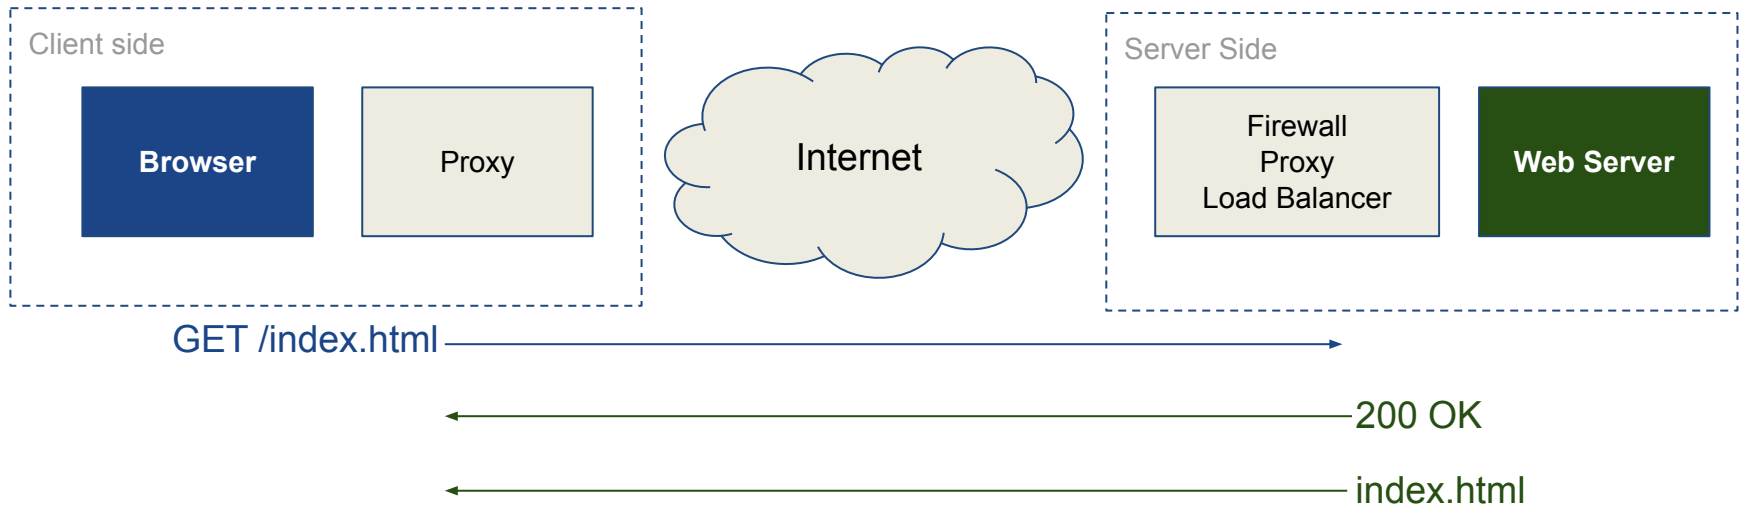

HTTP Protocol Conversation

HTTP: Have this file?

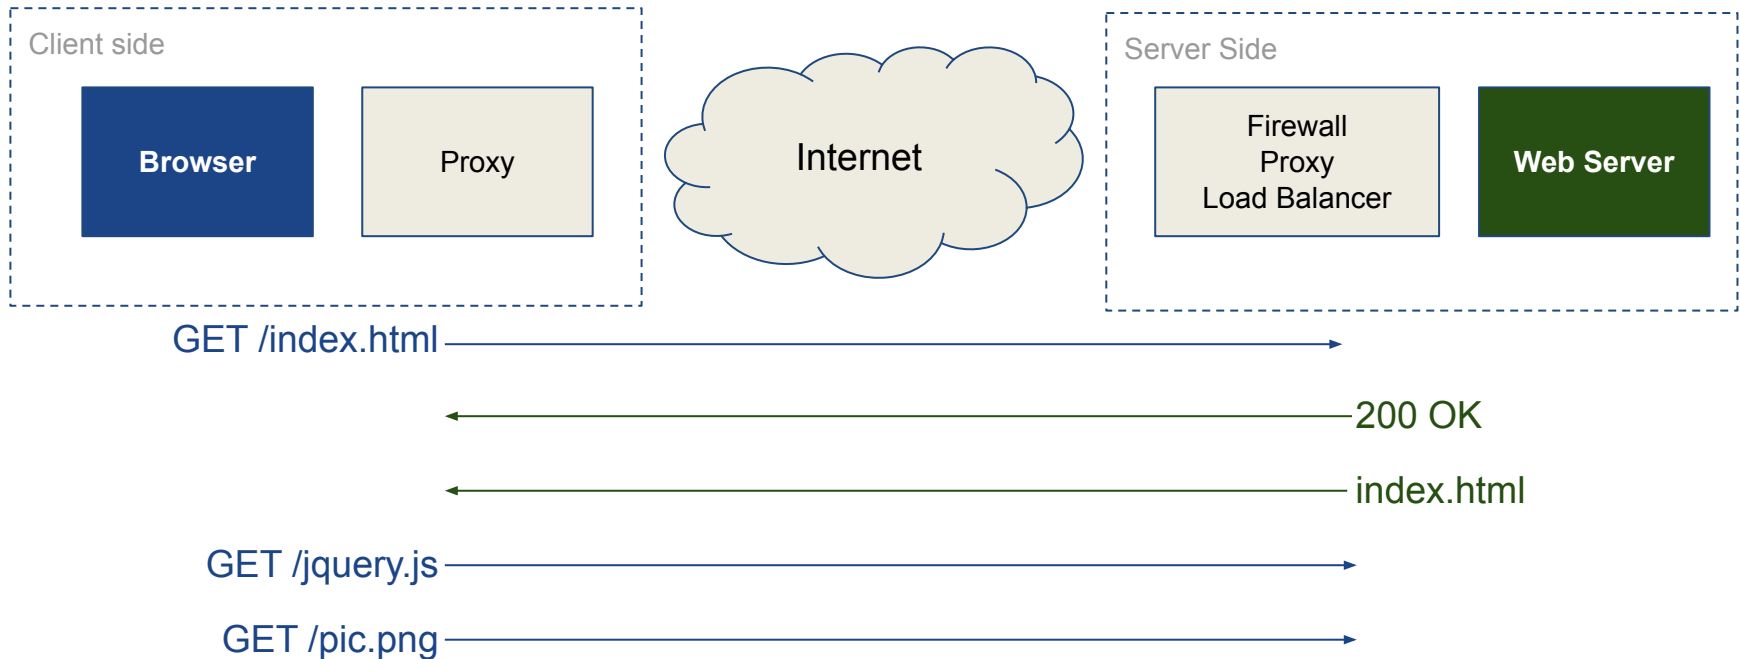

HTTP Protocol Conversation

HTTP: Yes, here you go...

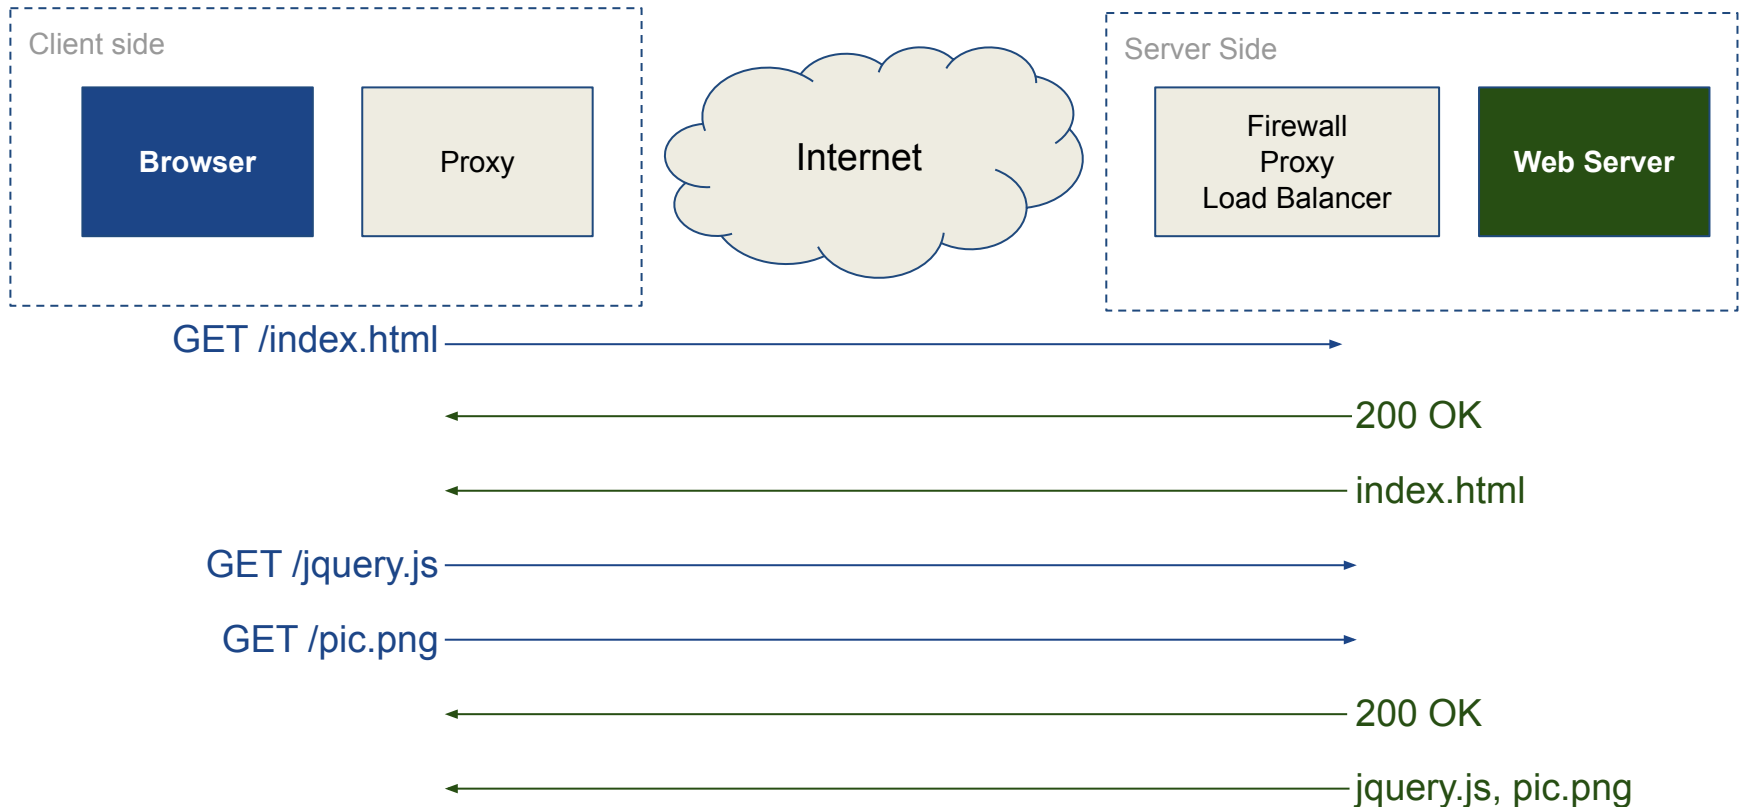

HTTP Protocol Conversation

HTTP: Now I need these...

HTTP Protocol Conversation

HTTP: No problem, here you go...

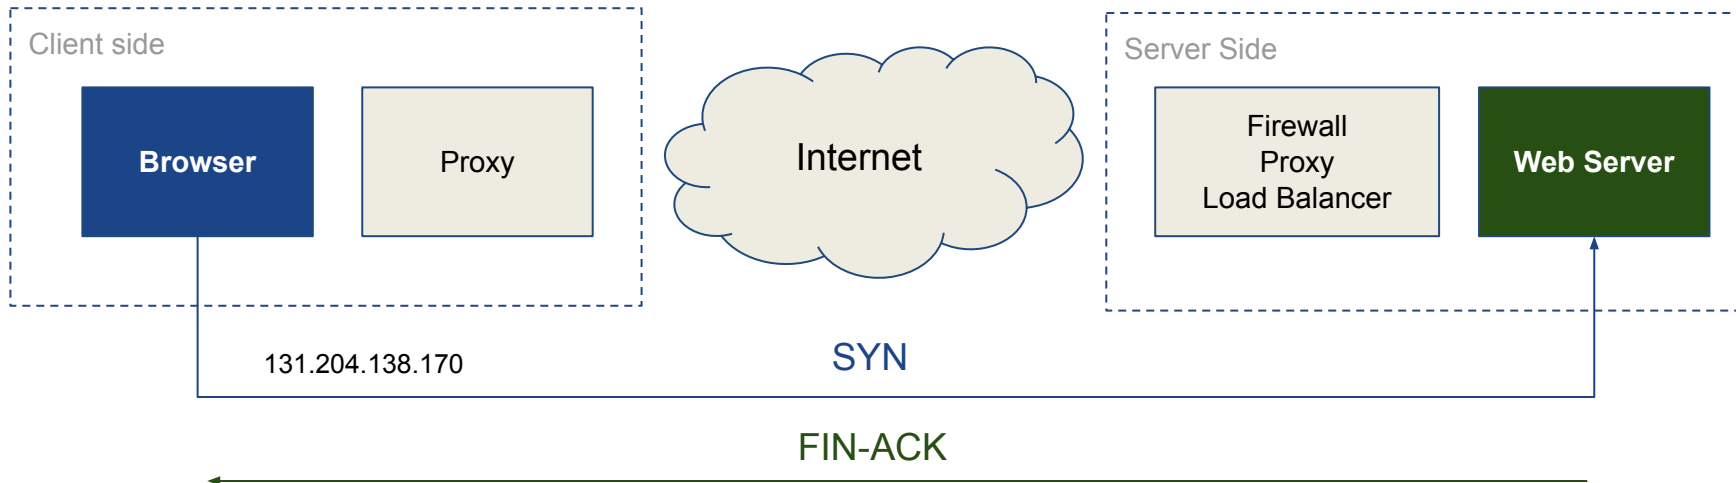

Close TCP Connection

TCP Connection: Goodbye

TCP Socket Connection to IP Address

TCP Connection: See ya!

Simply Put

AUBURN

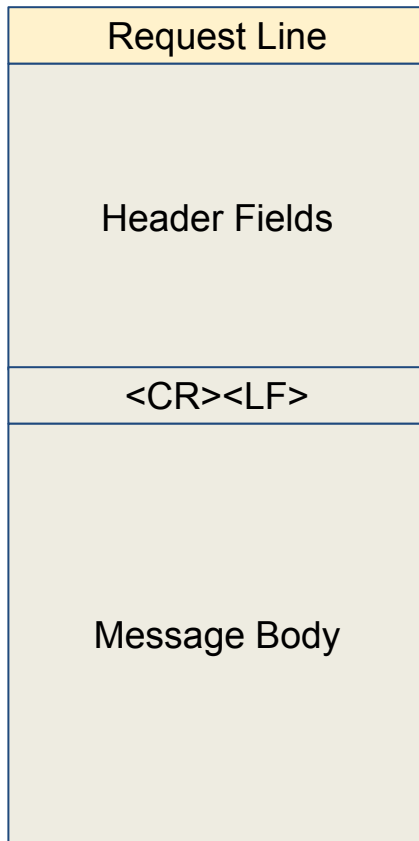

HTTP Request Structure

| | |
|---------------|---|
| Request Line | GET /index.html HTTP/1.1 |
| Header Fields | Host: localhost Accept: text/html X-Content-Type-Options: nosniff JSESSIONID: jd74jfhnmdnb37hdnndh |
| <CR><LF> | <CR><LF> |
| Message Body | <!DOCTYPE html> <html> <body> <h1>My Spring Boot Web App</h1> </body> </html> |

HTTP Request - Status Line

Format: <Method> <Request-URI> SP <HTTP-Version> CRLF

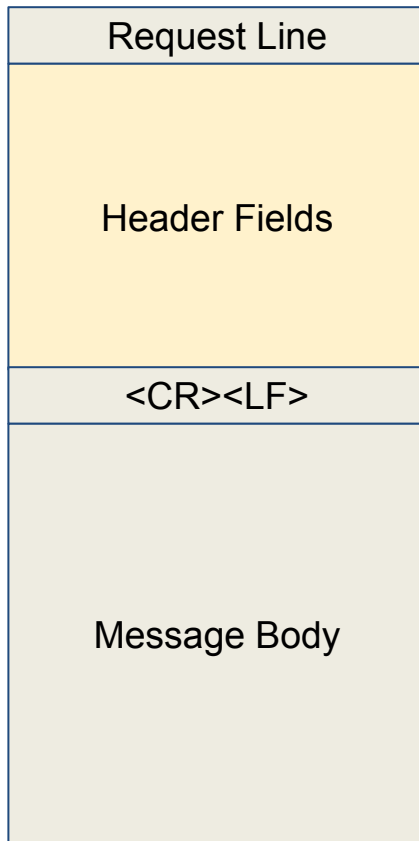

- Method
 - GET - retrieve information
 - POST - send information
 - PUT - create or update a resource
 - DELETE - delete a resource
- Request URI
 - Path to resource (file)
- HTTP-Version
 - Protocol Version to Use

HTTP Request - Header Fields

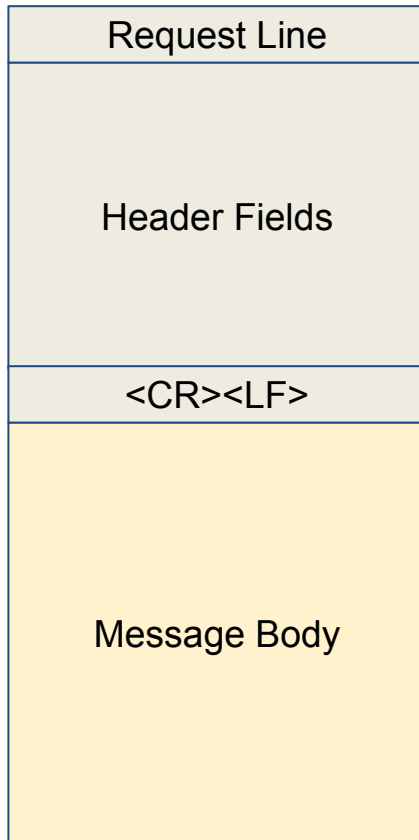

Format: <Tag>: <value> CRLF

- Header Fields
 - Client and the server pass additional information with an HTTP request or response.
 - Case-insensitive name followed by a colon (:) then by its value
 - For example: “Accept: text/html”

HTTP Request - Message Body

- Contains contents to be sent to server
- POST/UPDATE methods will use to contain data to send to the server.

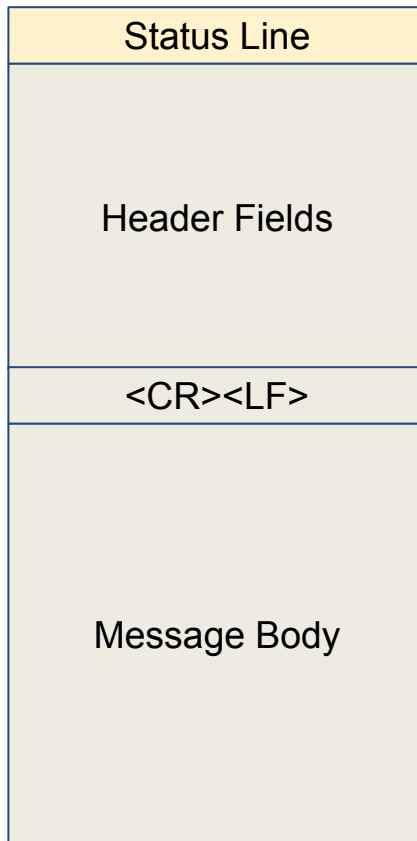

HTTP Response - Status line

Format: <HTTP-Version> <Status-Code> <Reason-Phrase> CRLF

Example: HTTP/1.1 200 OK

HTTP/1.1 404 Not Found

HTTP/1.1 500 Internal Server Error

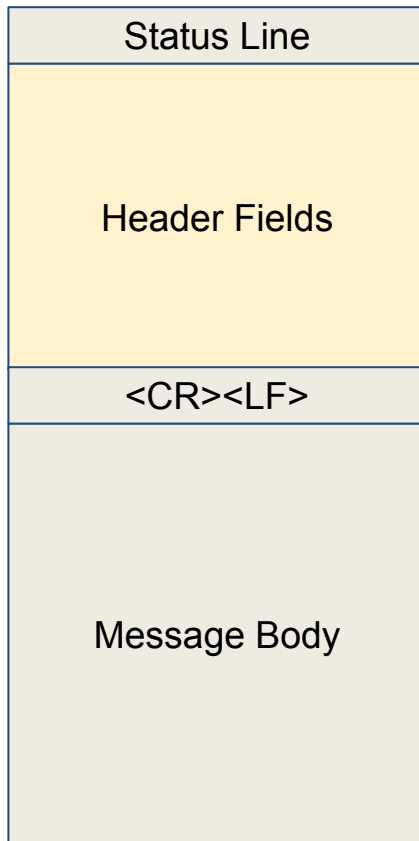

- HTTP-Version
 - Protocol version - “HTTP/1.1”
- Status Code
 - Indication of server response type
 - First digit defines response class
 - 1xx - Informational -
 - 2xx - Success - It worked!!
 - 3xx - Redirection - browser redirect
 - 4xx - Client Error - invalid request
 - 5xx - Server Error - internal server problem
- Reason-Phrase
 - Human readable message

HTTP Response - Head Fields

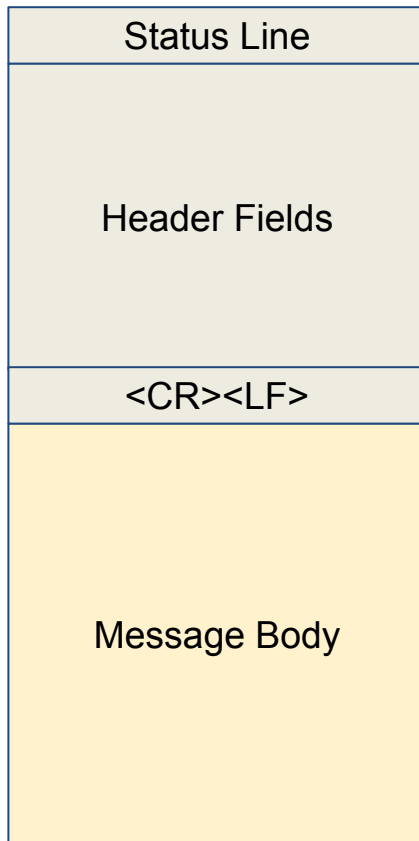

Format: <Tag>: <value> CRLF

- Header Fields
 - Client and the server pass additional information with an HTTP request or response.
 - Case-insensitive name followed by a colon (:) then by its value
 - For example: “Accept: text/html”

HTTP Response - Message Body

- Contains contents of the request resource
 - html files - returns exact contents

index.html

```
<html>
<body>
<h1>Hello, World!</h1>
</body>
</html>
```

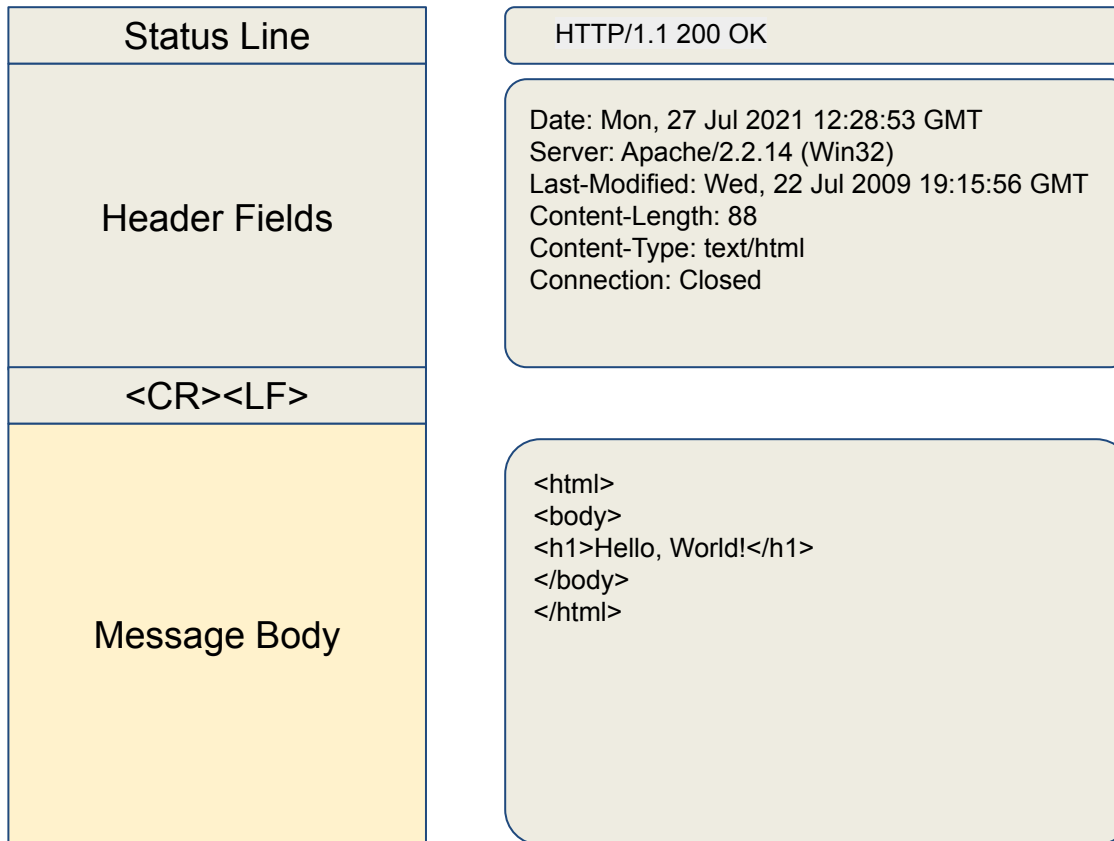

HTTP Request - Example

| Request Line | GET /index.html HTTP/1.1 | POST /login_handler HTTP/1.1 |
|---------------|--|--|
| Header Fields | User-Agent: Mozilla/4.0 Host: www.mywebsite.com Accept-Language: en-us Accept-Encoding: gzip, deflate Connection: Keep-Alive | User-Agent: Mozilla/4.0 Host: www.mywebsite.com Accept-Language: en-us Accept-Encoding: gzip, deflate Connection: Keep-Alive |
| <CR><LF> | | |
| Message Body | | user=aubie&password=myPa ssword |

HTTP Response - Example

HTTP is stateless

- Essentially means protocol does not save an information between requests
 - Up to the server and client to manage
- Enter “Cookies”
 - Data stored by client browser
 - Passed as values in the Header section on request and response
 - Maintains a “session” by storing information
 - Several key characteristics
 - name=value
 - expires=value
 - domain=value
 - path=value
